

Fellow Osprey Builders,

There is probably 1001 different ways of making your consoles and arranging your controls within them.

On my Osprey 2 (N3248V) console I've mounted the Water Rudder Control lever on the outside and use a spring loaded pawl for retracting and locking the water rudder in one motion. My console has 3/4" x 3/4" commercial aluminum angle stock as an edging and it works as a rub strip for the control lever.

On releasing the water rudder to the down position I grab the knob with thumb and forefinger of the right hand and with the middle finger release the pawl at the same time. There is no pinching of the finger.

The pawl is .070 x 7075 T 6 material, and the small tension spring holes are No. 50 hole size.
